

1. Detection Ratio

Detection Ratio: 0 / 92

This means that none of the 92 antivirus engines identified the URL as malicious.

2. URL Details

Analyzed URL

<https://www.youtube.com/@malluinsweden>

IP Address

192.178.209.190

3. Scan Engine Results

Several well-known security vendors analyzed the URL.

Some of them include:

- BitDefender
- AlienVault
- Cyble
- ADMINUSLabs
- CINS Army

- CRDF
- Dr.Web
- BlockList

All of these security engines reported the URL as **Clean**, indicating that no malicious content was detected during the scan.

Short Summary

During this internship task, I created a VirusTotal account and explored its dashboard to understand how the platform performs threat analysis. I learned that VirusTotal scans files, URLs, IP addresses, and domains using multiple antivirus engines and threat intelligence sources. I analyzed the URL <https://www.youtube.com/@malluinsweden>, and the results showed a **detection ratio of 0/92**, meaning none of the participating security vendors identified the URL as malicious. The report also displayed useful information such as the IP address, HTTP status code, content type, analysis history, and scan engine results. This exercise helped me understand how VirusTotal assists SOC analysts in verifying suspicious websites quickly and provides valuable threat intelligence during cybersecurity investigations. It also improved my understanding of interpreting VirusTotal reports and security indicators.
