

1. Explain UBA

UBA collects and analyzes data such as:

- Login times and locations
- File access patterns
- Application usage
- Network activity
- Privileged account actions

It uses statistical analysis and machine learning to identify behavior that differs from a user's normal pattern.

Example: If an employee usually logs in from Vancouver during business hours but suddenly logs in from another country at 3 AM and downloads hundreds of files, UBA flags this as unusual.

2. Identify Anomalies

Common anomalies detected by UBA include:

- Multiple failed login attempts
- Login from unusual locations or devices
- Accessing sensitive files not normally accessed
- Excessive file downloads or uploads
- Unusual working hours activity
- Privilege escalation attempts
- Sudden spikes in network traffic
- Access to systems outside the user's role

3. Suggest Risks

Potential risks associated with detected anomalies:

Anomaly	Possible Risk
Unusual login location	Account compromise
Multiple failed logins	Brute-force attack

Large file downloads

Data exfiltration

Privilege escalation

Insider threat or attacker gaining control

Access to restricted resources

Unauthorized access

Unusual network activity

Malware or command-and-control communication

Activity outside working hours

Compromised credentials
